# Lean Manufacturing Assessment

## TWELVE ELEMENTS OF LEAN MANUFACTURING

Lean Manufacturing consists of three management areas made up of 12 elements. These areas are Technology Management, People Management and Systems Management. Each area includes four elements of Lean Manufacturing. The **Technology Management** elements are Structured Flow Manufacturing, Small Lot Production, Setup Reduction, and Fitness for Use. The objective of Technology Management is a “Responsive Business Environment. “ This means developing flexibility to respond to changes in individual customer demand, changes in marketplace conditions or to produce to customer orders of one or one thousand. In other words, produce the product when and how the customer wants it.

**Figure 1: Three Key Management Areas in any Manufacturing Business**

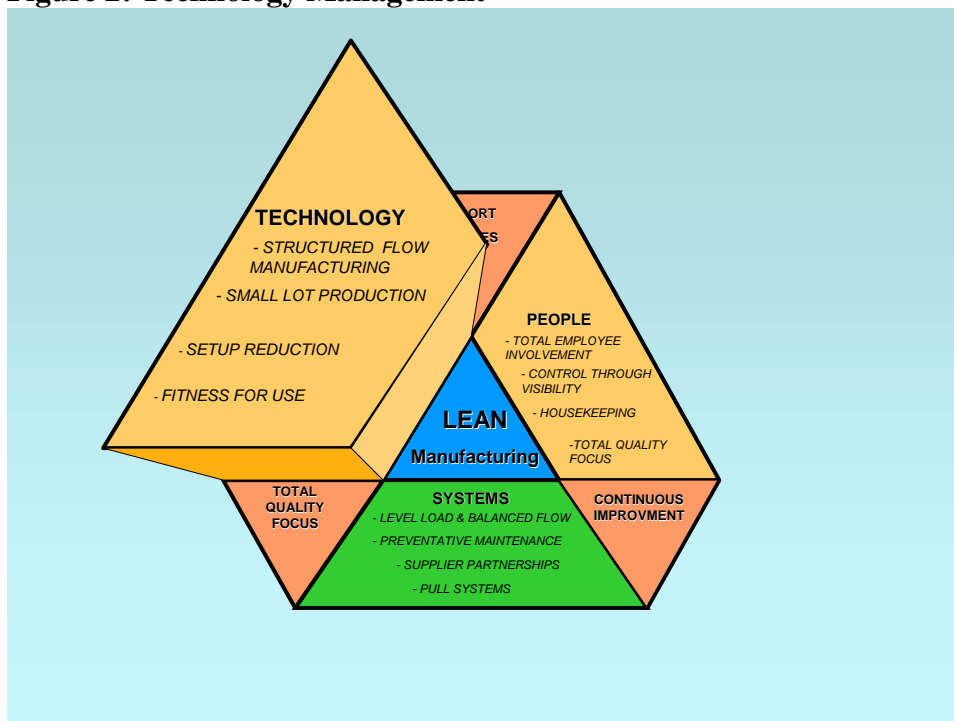

Structured Flow Manufacturing incorporates the concepts of continuous flow manufacturing. The focus is on flow and throughput to reduce the cycle time through manufacturing. It also should be noted that many companies have applied the concepts of Structured Flow Manufacturing to the office environment to shorten cycle time in the total business process. Structured Flow Manufacturing typically involves factory rearrangement or grouping technology into manufacturing cells for organized throughput.

Small lot production means producing the product in ever-decreasing lots or batch sizes until the theoretical lot size of one is reached. The ability to produce one at a time provides the opportunity to make every item every day. This in turn provides the flexibility of responding to customer requirements and meeting those requirements which otherwise could be met only through inventory.

Setup reduction or quick changeover is the process of minimizing equipment downtime between material changeovers. Setup time could be thought of as the elapsed time from the last good part of the previous job until the first good part of the new job is produced. The overall objective of reducing setup or changeover time is to facilitate small lot production.

Fitness for Use was coined by Dr. J.W. Juran in defining the principles of quality. Fitness for Use means understanding and meeting the customer's precise needs. The basic principle is that at each step in the business process there is a customer. Not all customers are external to the business; there also are internal customers. Internal customers are the next work center in the manufacturing process. Another example would be design engineering handing off new products to manufacturing in which case manufacturing is the customer of design engineering.

**Figure 2: Technology Management**

The elements of **People Management** are Total Employee Involvement, Control Through Visibility, Housekeeping, and Total Quality. The objective is “Capability for Rapid Improvement.” This means improvements transpire in the total business process on an ongoing or continuous basis. Continuous improvement is achieved through the involvement of people at all levels in the organization.

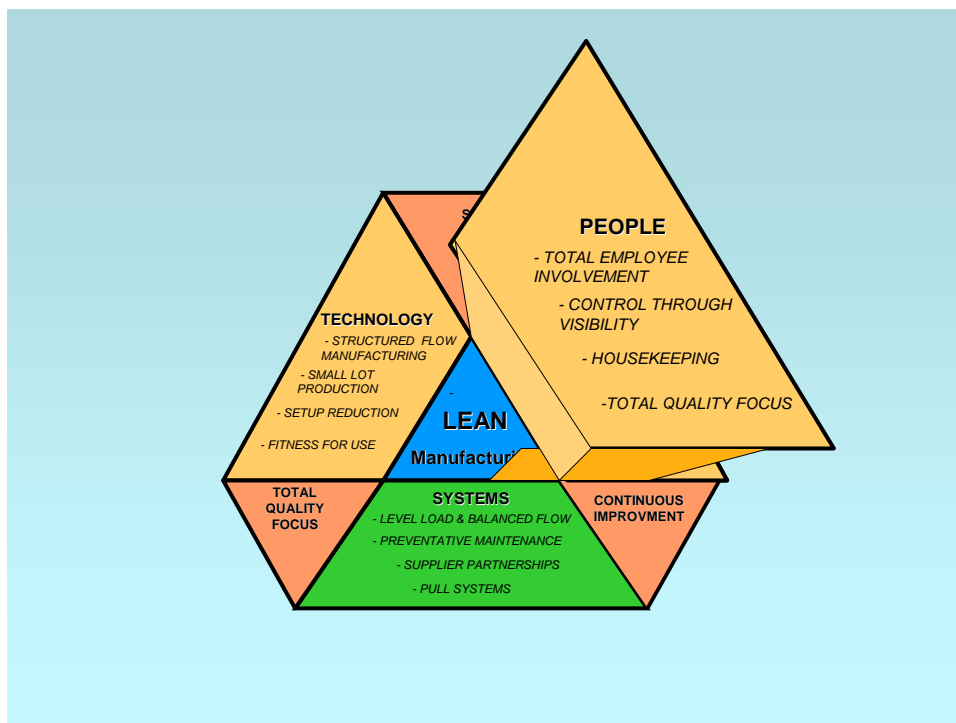

Total Employee Involvement is required to achieve the objective of Capability for Rapid Improvement. Only by everyone being involved in the improvement process can a company achieve continuous improvement in its processes. Employee involvement and continuous improvement will be achieved through Small Group Improvement Activities, typically process improvement teams and/or Kaizen events to implement rapid change.

Control Through Visibility provides visual status of the production environment. The objectives in Control Through Visibility are to communicate goals, highlight problems and attack waste. Often times Control Through Visibility is looked at as an extension of basic housekeeping, the idea being that as unnecessary items are removed from the work area it becomes much easier to see and thus work on process problems.

"5S" Housekeeping or work place organization means a highly organized and efficient work place. In "5S" Sort, Set in Order, Shine, Standardize and Sustain help to create a high performance workplace that eliminates waste of time, motion and effort as everything (materials and tooling) have a place and everything is in its place.

Total Quality is fundamental to Lean Manufacturing and can be defined as striving to continually reduce process variability and create repeatable processes.. Variations in the process increase costs, and must be managed to improve quality. The primary focus is supplier quality, in box quality and out of box quality – customer escapes.

**Figure 3: People Management**

The **Systems Management** elements are Level Load and Balanced Flow, Preventative Maintenance, Supplier Partnerships and Pull Systems. The objective is “Careful Application of Resources” which means using all company resources wisely. This can be achieved in Lean Manufacturing by extending equipment life, eliminating over-production and developing efficient production processes through the use of Pull Systems.

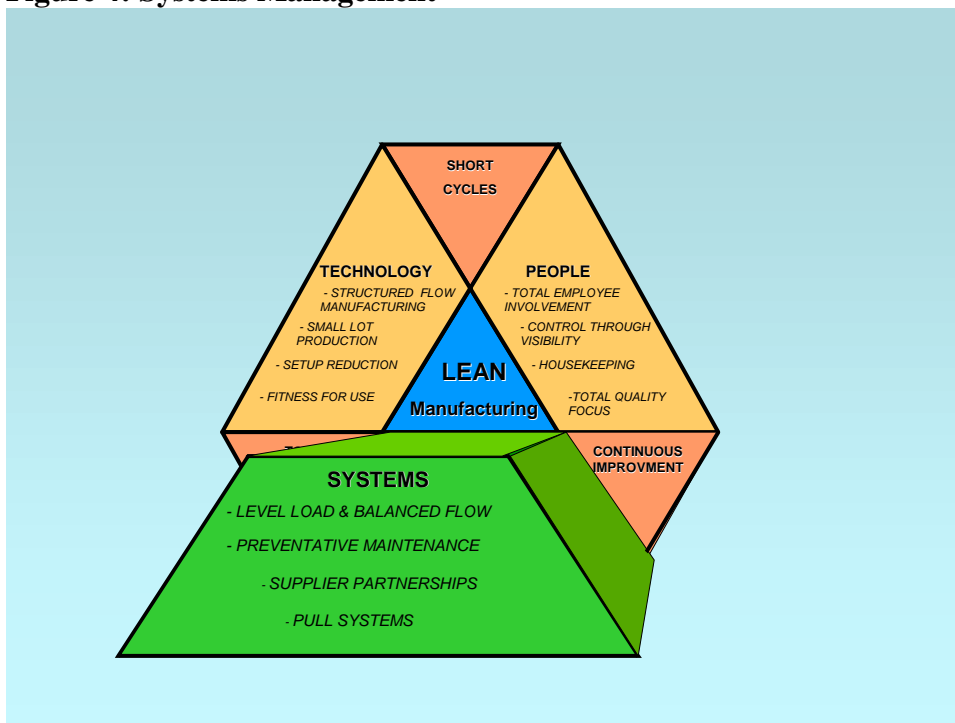

Level Load and Balanced Flow means organizing production processes for scheduled throughput. Leveling and balancing become control mechanisms. The objective is to achieve synchronous production through repeatability and predictability in process cycles.

Preventative Maintenance in Lean Manufacturing means developing reliable tools of production that run flawlessly. Equipment is in a constant state of readiness with the benefits being extended life of equipment, equipment eliminated as a cause of defects, and prevention of major equipment repairs.

Supplier Partnerships will be a total management and company commitment to a cooperative relationship with suppliers. This cooperative relationship will focus on achieving lowest total cost by working on non-price areas of the relationship. The cornerstones of the relationship will be long-term commitments, shared goals and frequent fact-based communications utilizing consignment and Kanban material execution.

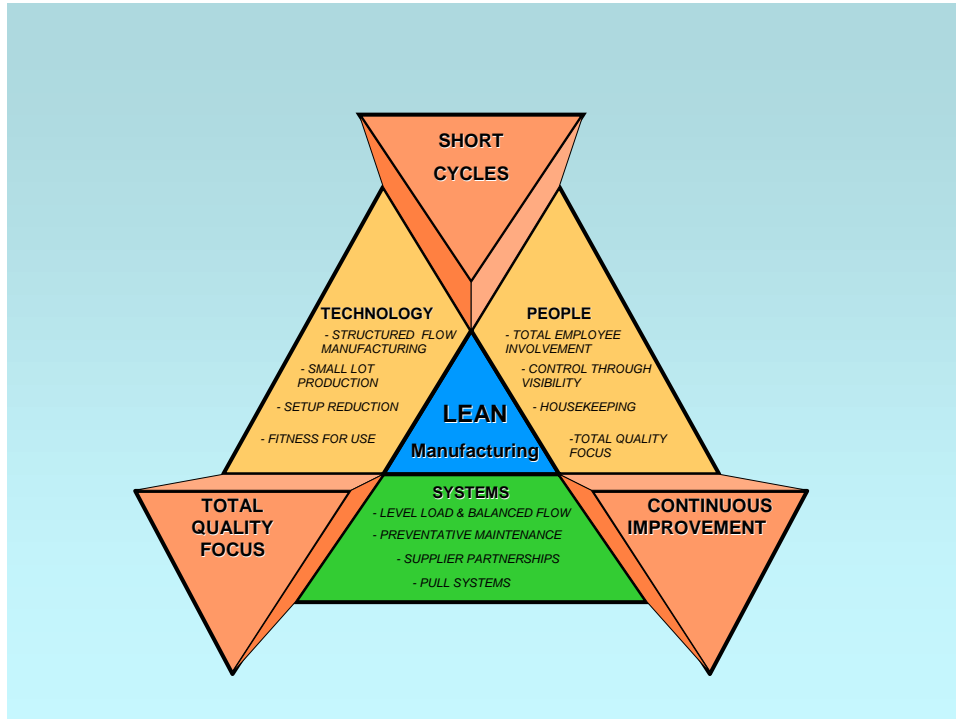

Pull Systems, often referred to as Kanban, are the mechanisms that activate internal production and supplier processes. The objectives of the Pull System are three-fold: (1) keep the time of producing material as close as possible to the time of using material; (2) maintain accurate and rapid feedback on what really is needed in the work area; and (3) provide local control over stocking levels in the area.

**Figure 4: Systems Management**

Each manufacturing environment that Buker, Inc. has worked with has all 12 of the Lean Manufacturing elements in place. It should be noted that the degree of application of the 12 elements in each company can and may be different. For example, in a traditional job shop manufacturer there could be tremendous application of structured flow manufacturing for improved throughput, thus leading to cycle time reduction, while another company that is a process manufacturer already may understand the importance of structured flow manufacturing, but may need to focus on preventative maintenance and setup reduction.

**Figure 5: Short Manufacturing Cycles**

The result of achieving short manufacturing cycles, continuous improvement and a total quality focus is Lean Manufacturing. Lean Manufacturing then is the result rather than the beginning.

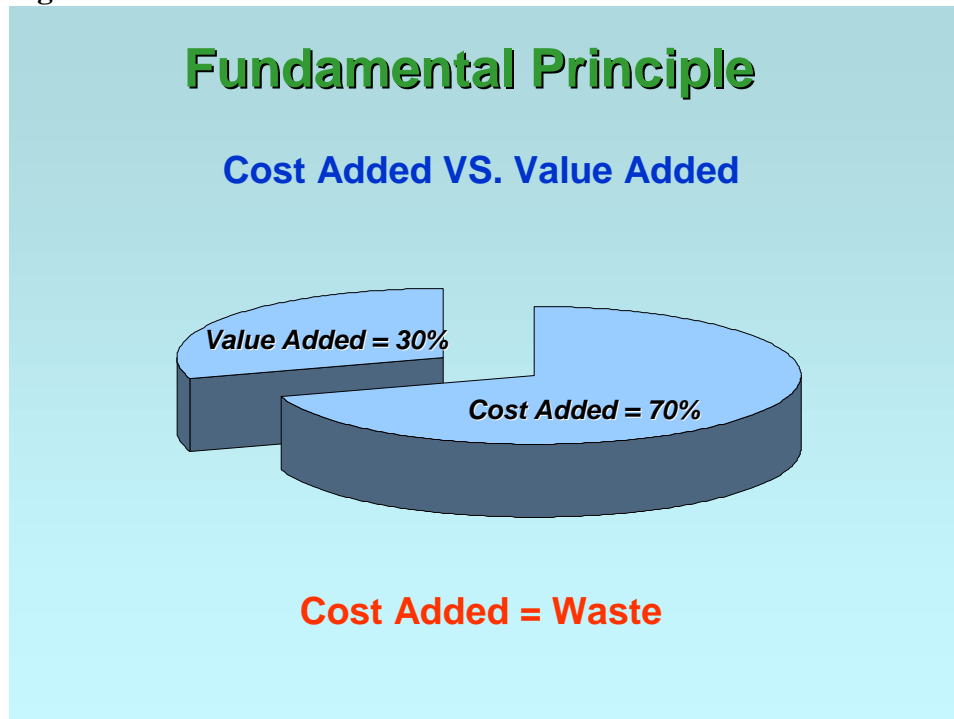

**Figure 6 : Lean Manufacturing Definition**

# LEAN MANUFACTURING

**Lean Manufacturing is a strategy for achieving significant, continuous improvement in performance through the elimination of all waste of time and resources in the total business process.**

Two significant components of the definition of Lean Manufacturing are elimination of waste and continuous improvement. Elimination of waste means eliminating all activities that do not add value to the process. As an example, moving materials from one manufacturing operation to another is not adding value to the product but rather adding cost.

**Figure 7: Cost-added vs. Value-Added**

Another way to think of cost-added and value-added is to think of cost-added as motion and value-added as work. Thus, are the activities truly work or value-adding or are they motion, adding cost? Examples of cost-added activities are material movement, inspection, taking material out of one container and putting it into another, engineering change notices, rework and material storage. In a Lean Manufacturing environment, the goal is to reduce the cost-added activities so that the value-added activities become 90 percent of the total cost. This strategy lowers total cost significantly and enhances competitiveness and profitability. Recognizing cost-added activities in a company is not easy. Over the years the cost-added activities have been taken for granted and have become invisible. They are assumed to be the way a company has always done business. This mind set must be changed in Lean Manufacturing.

**Figure 8: 3 Step Rule For Reducing Waste**

<b>3 Step Rule For Reducing Waste</b>	
<b>STEPS</b>	<b>REDUCTION</b>
<b>1. REDUCED BY 50%</b>	<b>50%</b>
<b>2. REDUCED BY 50% AGAIN</b>	<b>75%</b>
<b>3. MAKE IT 10% OF WHAT IT WAS</b>	<b>90%</b>

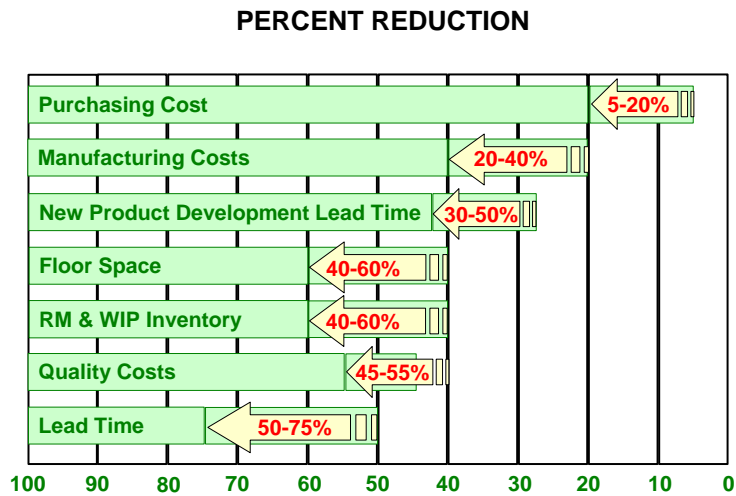

In reducing waste or cost added activities, the first step is to cut or trim the waste by 50 percent. Step two: reduce by 50 percent again which yields a 75 percent cumulative reduction. The final step is making it 10 percent of what it was for a cumulative reduction of 90 percent. A typical application of the three-step rule is the chronic waste existing in most manufacturing facilities - setup time. If a setup or changeover on equipment is presently two hours (120 minutes), step one would be to reduce the setup to one hour (60 minutes) or cut it in half. Step two would cut it in half again or now down to one half hour (30 minutes). Step three would be to make it 10 percent of what it was which means the setup time is down to 12 minutes. A dramatic improvement. Attacking waste in this manner requires a fundamental rethinking of setup activities. Superficial actions rarely result in the reduction of waste called for in the Three Step Rule.

**Lean Manufacturing Results:**

The average improvements we at Buker, Inc. have seen are represented in figure 9.

Figure 9: Lean Manufacturing Results

## LEAN MANUFACTURING RESULTS

To achieve these results means revolutionary change in the way a company does business. It means developing a disciplined, watchful company culture, one that distinguishes cost-added from value-added activities in all areas of the business, and attacks waste of time and resources whenever and wherever found. That disciplined culture requires adopting revolutionary new attitudes, new attitudes that having problems is good news, because acknowledging them means they can be solved. Lean Manufacturing is the beginning of a new world for manufacturers that brings continuous change and continuous improvement. Once a company accepts the challenge of Lean Manufacturing it becomes a forever commitment.

# Lean Manufacturing Assessment

The Lean Manufacturing Assessment offers companies beginning their Lean journey a methodology to identify where a company can have the most impact and fastest payback both in the beginning and throughout their Lean initiative.

The Lean Assessment can also be used by companies actively engaged in their Lean journey. The assessment offers these companies the opportunity to benchmark themselves against the “best in class” Lean standard. Based upon the benchmarking exercise of comparing the company’s Lean practices to the Lean Manufacturing Assessment “best in class” standard a company can define remaining areas of improvement in their Lean initiative.

## Conducting the Lean Manufacturing Assessment

The Lean Manufacturing Assessment is divided into fourteen (14) areas:

1. Cultural Awareness
2. Structured Flow Manufacturing
3. Small Lot Production
4. Setup Reduction
5. Fitness For Use
6. Employee Involvement
7. Control Through Visibility
8. Housekeeping/Workplace Organization
9. Total Quality Focus
10. Level Load and Balanced Flow
11. Preventive Maintenance
12. Supplier Partnerships
13. Pull Systems
14. Education and Training

The assessment should be reviewed and conducted by the company’s management team. Conducting the assessment review as a team avoids the assessment results being just one person’s opinion and provides the management team the opportunity to candidly discuss the company’s current condition and where to start their efforts.

The Lean Manufacturing Assessment asks a series of questions regarding the “current state of operations” as compared to the standard in a Lean Manufacturing company. The response to each question is either:

A – Best practice standard is in place.

RI – Requires Improvement – The practice was found during the assessment but the process is sub-standard or not fully implemented throughout the enterprise.

F – The practice is not found.

For each area where RI or F is recorded during the assessment the area should be identified and discussed by company management as a potential starting point or area for opportunity in their Lean effort. It should be noted specific areas such as housekeeping/workplace organization, and education and training are fundamental elements for starting any company’s Lean Manufacturing journey.

## Lean Manufacturing

### Cultural Awareness

#### Expectation

Plant management communicates with shop floor workers regarding employee satisfaction and organizational objectives at least twice per year.

#### Evidence

- 

#### Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

#### Expectation

Employees are able to accurately describe the organizations goals and how their job contributes to the achievement of those goals.

#### Evidence

- 

#### Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

#### Expectation

There is a formal process for production workers to regularly receive feedback on problems detected in downstream processes and at the customer.

#### Evidence

- 

#### Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

#### Expectation

There is a formal process in place that provides shop floor workers the opportunity to work in groups to address performance, quality, or safety issues.

#### Evidence

- 

#### Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

#### Expectation

Shop floor employees understand and can use common performance metrics to monitor and improve production processes.

#### Evidence

- 

#### Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

**A = Acceptable/Best practice in place**

**RI = Requires Improvements / the practice is found but process is substandard or not integrated throughout the enterprise**

**F = Failed / the practice is not found**

# Lean Manufacturing Assessment

**Company:** \_\_\_\_\_

**Location:** \_\_\_\_\_

**Audit Date:** \_\_\_\_\_

Expectation When problems in the production process occur they are detected and investigated within 10 minutes of the first occurrence.	Evidence •	Evaluation A   RI   F
--	---------------	--------------------------

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation Production engineers and support staff routinely go to the spot of a problem in production to assess the actual situation and talk to production workers.	Evidence •	Evaluation A   RI   F
--	---------------	--------------------------

	Observation	Action	Responsibility	Date
Site	•	•	•	•

## Structured Flow Manufacturing

Expectation Operators are given a formal training period before doing a job on their own. Few defects or production slowdowns are attributable to new/inexperienced operators.	Evidence •	Evaluation A   RI   F
---	---------------	--------------------------

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation Part travel distances have been analyzed and reduced by moving equipment and workstations closer together. (E.g. Wasteful material conveyance has been eliminated by reducing the distance between processes, work cells, process groups, or material staging areas.)	Evidence •	Evaluation A   RI   F
--	---------------	--------------------------

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation Subassembly or production areas that supply a main production line or cell(s) do not change-over early to build inventory buffers, etc. (E.g. Changeovers are synchronized across related production processes.)	Evidence •	Evaluation A   RI   F
---	---------------	--------------------------

	Observation	Action	Responsibility	Date
Site	•	•	•	•

**A = Acceptable/Best practice in place**

**RI = Requires Improvements / the practice is found but process is substandard or not integrated throughout the enterprise**

**F = Failed / the practice is not found**

# Lean Manufacturing Assessment

**Company:** \_\_\_\_\_

**Location:** \_\_\_\_\_

**Audit Date:** \_\_\_\_\_

Expectation

Defective items are immediately detected when they occur in the production process. (E.g. Very seldom does a bad part make it to a down stream process or to the customer with a lot of suspect parts in between requiring additional inspection.)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Processes and equipment are arranged to facilitate a continuous flow of work through production and not arranged in machinery or process groups. (E.g. WIP inventory does not accumulate after processes. Machines or equipment groups do not bottle-neck the material flow, etc.)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

The Ratio of actual to theoretical cycle time shows continuous improvement month to month.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Production operators are multi-process capable, fully trained and able to do the work at each station in a production cell or each job in a production line team.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

U-turn layouts and U-shaped cells have been implemented on the shop floor to enable one-piece (continuous) flow of material through production.

Evidence

- 

Evaluation

**A = Acceptable/Best practice in place**

**RI = Requires Improvements / the practice is found but process is substandard or not integrated throughout the enterprise**

**F = Failed / the practice is not found**

# Lean Manufacturing Assessment

**Company:** \_\_\_\_\_

**Location:** \_\_\_\_\_

**Audit Date:** \_\_\_\_\_

Expectation

Takt time determines the pace of production in the plant. (*E.g., Takt time = Production time available / Customer volume*)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

The Takt time is used as the basis to determine process cycle times and allocate work throughout the production process. (*E.g., Production processes are designed with cycle times that does not exceed the Takt time.*)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Processes on production lines or in cells are balanced or leveled so the difference between cycle times of linked processes is negligible.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

When demand volumes increase, production processes are rebalanced or redesigned to reduce the process cycle times to correspond to the new Takt time.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Performance to the plan is measured in daily or hourly rates.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

**A = Acceptable/Best practice in place**

**RI = Requires Improvements / the practice is found but process is substandard or not integrated throughout the enterprise**

**F = Failed / the practice is not found**

# Lean Manufacturing Assessment

**Company:** \_\_\_\_\_

**Location:** \_\_\_\_\_

**Audit Date:** \_\_\_\_\_

Expectation

Output to plan by day or hour is  $\pm 5\%$  to plan.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

## Preventative Maintenance

Expectation

Maintenance team managers and workers have been trained in the basics of TPM.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Machines have all safety guard devices operative, and are locked out immediately when broken down. (E.g., Safety guards are not disabled or removed. Malfunctioning equipment is not allowed to continue operating in production.)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Preventive maintenance activity lists are posted in work areas and item completions are tracked over time.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Accurate and visible maintenance records are kept up to date and posted nearby for all production machinery.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

**A = Acceptable/Best practice in place**

**RI = Requires Improvements / the practice is found but process is substandard or not integrated throughout the enterprise**

**F = Failed / the practice is not found**

# Lean Manufacturing Assessment

**Company:** \_\_\_\_\_

**Location:** \_\_\_\_\_

**Audit Date:** \_\_\_\_\_

Expectation

Preventive maintenance activities are focused on increasing utilization and minimizing cycle time variation. (E.g., Capacity utilization is tracked and cycle time performance is monitored for each machine and issued in maintenance activity planning. The maintenance team is evolving from preventive to predictive abilities.)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Preventive maintenance responsibilities are defined for both maintenance and production workers. (E.g., Operators are doing routing tasks like checking oil, cleaning machines, & changing tools.)

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Maintenance is scheduled as part of the overall production plan.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

## Supplier Partnerships

Expectation

Suppliers have early involvement in the design process for new products.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•

Expectation

Suppliers are at least quarterly provided feedback on delivery, quality and service.

Evidence

- 

Evaluation

A	RI	F

	Observation	Action	Responsibility	Date
Site	•	•	•	•
